Family Name	First Name	Attending Physician	Room No.	Hosp. No.	Date
CHAPMAN,	BRIAN	C. M. PARRISH, M.D.	206b	2296382	4-5-76

OPERATION:

- 1) Bilateral selective renals.
- 2) Caval angiogram.

Surgeon:

Dr. C. M. Parrish

Preop. Diagnosis:

Question of right renal tumor.

Postop. Diagnosis:

This is a large right renal most likely Wilms type of tumor with extension into the left renal vein and cava.

FINDINGS:

This boy of 6 or 7 years had hematuria and came in for studies. He was found to have a right-renal mass.

By the trans right common femoral percutaneous technique a #5 catheter was placed into the right renal. We have beautiful pictures of a large expanding mid renal mass that seems to be going a little bit beyond its borders medially. The left kidney is totally normal. We then have also caval pictures with a pressure injector and there is every indication that there is tumor at the right renal venous input into the cava. This is a most interesting angiographic study.
